

Python is a high-level programming language created by Guido van Rossum and first released in 1991. It is dynamically typed and known for its readable syntax. Python is widely used in data science, web development and automation.

HTTP status codes indicate the result of a request. Code 200 means OK, the request succeeded. Code 404 means Not Found, the resource does not exist. Code 500 means Internal Server Error, a generic server failure.

A vector database stores high-dimensional embeddings and enables similarity search. Qdrant is an open-source vector database. Similarity is often measured with cosine distance between vectors. Such databases power retrieval-augmented generation.

Git is a distributed version control system created by Linus Torvalds in 2005. It tracks changes in source code and supports branching and merging. GitHub is a popular platform for hosting Git repositories.

JSON, JavaScript Object Notation, is a lightweight data-interchange format. It represents data as key-value pairs and ordered lists. JSON is language-independent and widely used in web APIs.
